

$$I = I_{ph} - I_d - \frac{I R_s + V}{R_{sh}} \quad V = \frac{kT}{q} \ln \left(\frac{I_{ph}}{I} \right)$$

4. The figure below shows the current (I) – voltage (V) curve of a solar module (black curve) and corresponding power curves (power as the function of voltage, gray curve), measured at the standard test conditions (STC, radiation intensity 1000 W/m^2 , $T = 25^\circ \text{C}$, AM1.5G spectrum). The dimensions of the module are $600 \times 1000 \text{ mm}$. Estimate the open circuit voltage (V_{OC}), short circuit current (I_{SC}), fill factor (FF), and energy conversion efficiency (η) of the module in the following two cases:

- Initial case, as in the Figure (3 p)
- Initial case, but with series resistance (R_s) of the module increased from its initial value by 1Ω (3 p)

5. Explain shortly following definitions (each 1 p)
- Trombe-wall
 - Thermosyphon
 - Heat produced by a typical solar heating system in Southern Finland (kWh/m^2 per year)?
 - Hottel–Whillier–Bliss (HWB) equation
 - Fin efficiency of a solar collector
 - Threshold intensity (kynnysintensiteetti)

$$I = \frac{V}{R} \Rightarrow R = \frac{V}{I}$$

$$V_d = I R_s + V$$

$$I_0 \left(\exp \frac{qV}{kT} - 1 \right)$$

$$I_{ph} =$$

$$I R_s + V$$

$$I = I_{ph} - I_d$$

$$\Rightarrow I_{ph} - I_d - \frac{I R_s + V}{R_{sh}} = 0$$
