

CHEM-E7105 – Process Development

Name: _____ Student nr: _____

-
- Be short, but precise in your answers.
 - Avoid telling stories!
 - Calculator can be used.
-

1a) Why and by which chemical sectors batch processes are used in chemical industry [3]

1b) Describe shortly the batch process of figure A [3]

Batch Process

Figure A. Batch process

2) Mechanistic models in chemical engineering [6]

3a) What information is needed for thermal safety [2]

3b) Methods for preventing corrosion [2]

3c) Selection criteria for the safe manufacturing [2]

4) Principles of process intensification [6]

5. Balance calculation [12]

Sulphuric acid can be produced by two absorption routes. In the first route, sulphur trioxide is contacted with water by chemical absorption

Another way is to use so-called contact process by absorbing sulphur trioxide to sulphuric acid and forming first fuming sulphuric acid (oleum, $\text{H}_2\text{SO}_4 \cdot \text{SO}_3$)

Oleum is then reacted with water to form concentrated sulphuric acid.

- Which route is more appropriate by inspecting the heats of formation of the components?
- Calculate mass balance for the route 2 (products; moles, masses, volumes weight percentages) for an absorption where 20 kmol/h of H_2SO_4 (99 wt.% acid, rest is water) is scrubbed with equimolar amount of SO_3 gas at 50 °C and 1 bar pressure ($R=8.314 \frac{\text{J}}{\text{mol/K}}$). Note that water in feed H_2SO_4 also reacts to H_2SO_4 according route 1 reaction scheme.
- If the absorber diameter of route 2 process is 500 mm, what is the superficial velocity of SO_3 gas?

INFORMATION

Substance	MW	ρ_L	ΔH_f
	g/mol	kg/m ³	kJ/mol
H_2SO_4	98.08	1842	-814.0
SO_3	80.06	1850	-395.7
H_2O	18.01	1000	-285.8
Oleum	178.14	see fig. B	-683.92

ΔH_f , heat of formation

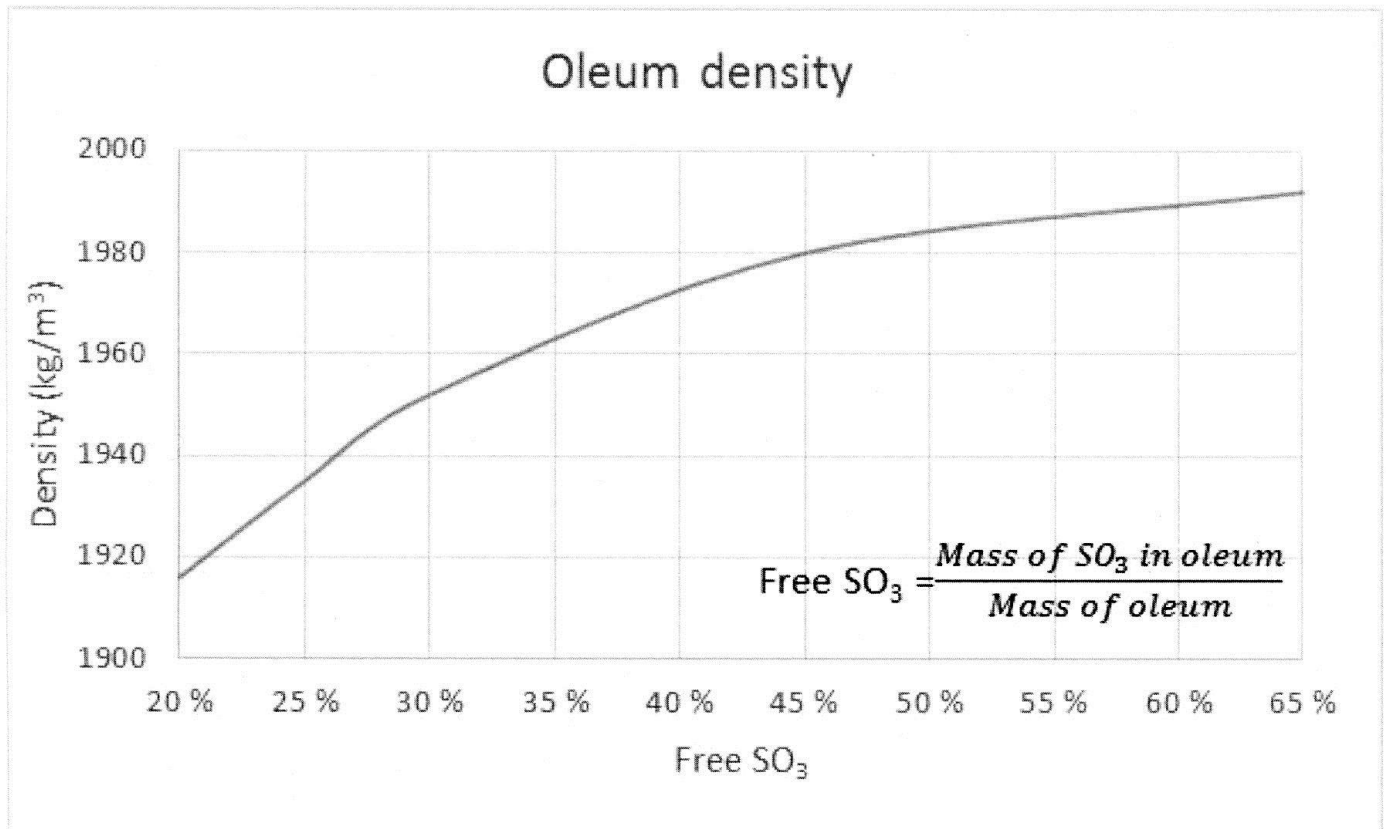

Figure B. Oleum density
