

Assignment 1 Amdahl's law states the maximum available speedup of a program which has proportion P of parallel code and $1 - P$ of sequential code, and N processors working in parallel. Compute the speedup of code with $N = 256$.

- a) In the case $P = 90\%$. (1p)
- b) In the case $P = 95\%$. (1p)
- c) In the case $P = 99\%$. (1p)

Assignment 2 In this problem we assume that a single disk inside a RAID 5 array has died. In order to recompute the missing data, the data stored on all the remaining disks has to be read. The task is to consider the number of expected read errors during the reconstruction of the data.

When using consumer hard disks in RAID 5 configuration, compute the expected number of URE errors during RAID 5 array rebuild. Use a Bernoulli process model the URE errors with the typical consumer URE rate of 1 bit error per 10^{15} bits read.

Assume the RAID 5 arrays are full of data and consist of the following amounts of storage space:

- a) 16 TB (1p)
- b) 32 TB (1p)
- c) 64TB (1p)

Assignment 3 Briefly (using at most half a page of text maximum) describe what is the statement called as the CAP Theorem and what implications does it have for design of distributed systems both on the theoretical as well as on the practical level. (4p)

Assignment 4 Bloom filters are a probabilistic data structure for storing sets of items. Consider the case of a Bloom filter with 8 megabytes of memory, where we would like to insert at most $n = 1000000$ items. What is the approximate optimal number of hash functions k to minimize the number of false positives? What is the false positive probability with using that k (rounded to the nearest integer) after having inserted n unique items? (4p)

Note! More assignments on the other side of the paper.

Assignment 5 Please briefly (using maximum of three sentences for each case) define what are the following concepts as used in the course lectures or tutorials:

- a) FLP Theorem (1p)
- b) Bernoulli process (1p)
- c) RAID 10 (1p)
- d) Consistent hashing (1p)
- e) Scaling up (1p)
- f) RAID write hole problem (1p)

Assignment 6 Briefly (using at most half a page of text maximum) describe the MapReduce programming paradigm and its relation to fault tolerance and functional programming. (4p)
