## CIV-E 4110 Timber Engineering

## Examination date 27.5.2020

## General

- Write clearly on every paper you hand in: the code and name of the course, the date of the exam, your full name, your student number and your signature.
- Write clear and show intermediate steps.
- If some intermediate results are missing, choose an assumption (make a clear mark!) and continue the calculation.
- Use the material properties given in the appendix.

## Question

A column (GL28h, $h=9 \mathrm{~m}$ ) is loaded with a point design load $F_{\mathrm{d}}=140 \mathrm{kN}$ and a uniformly distributed design load $q_{\mathrm{d}}=5 \mathrm{kN} / \mathrm{m}$. Load-duration class Medium-term and Service class 1 apply. The dimensions of the column are $t \times w=160 \times 400 \mathrm{~mm}^{2}$ (the stronger axis is in plane direction).
a.) Calculate the reaction forces and the internal forces. ( 0.5 points)
b.) Check the stability of the column. (6 points)

A single supported beam (GL28h, $l=20 \mathrm{~m}$ ) is loaded with a uniformly distributed design load $q_{\mathrm{d}}=11 \mathrm{kN} / \mathrm{m}$. The load applies at the compression edge of the beam. In the middle the beam is supported against lateral buckling. Load-duration class Medium-term and Service class 2 apply. The dimensions of the beam are $b \times h=200 \times 1200 \mathrm{~mm}^{2}$.
c.) Calculate the effective length of the beam. (1 points)
d.) Check the stability of the beam. (3.5 points)

## Question

GLT beams (GL24h) are connected with a dowel connection. The dowel diameter $d=14 \mathrm{~mm}$. The design load $N_{\mathrm{d}}=100 \mathrm{kN}$ (axial load). Load-duration class Medium-term and Service class 2 apply. The thickness of the steel plate is 10 mm (no proof required).
a.) Calculate the design load-carrying capacity per shear plane per fastener. (4.5 points)

Answer the following questions ONLY for the diagonal tensile member:
b.) Calculated the minimum spacings and edge and end distances for the dowels and illustrate it. (2 points)
c.) Find the required number of dowels (for 2 dowel rows) and check the resistance of the connection. (2.5 points)
d.) Check the resistance of the beam. (2 points)

## CIV-E 4110 Timber Engineering

## Examination date 27.5.2020

## General

- Write clearly on every paper you hand in: the code and name of the course, the date of the exam, your full name, your student number and your signature.
- Write clear and show intermediate steps.
- If some intermediate results are missing, choose an assumption (make a clear mark!) and continue the calculation.
- Use the material properties given in the appendix.

## Question

A LVL beam (Kerto-S, $l_{1}=2 \mathrm{~m}, l_{2}=7 \mathrm{~m}$ ) is loaded with a uniformly distributed design load $q_{\mathrm{d}}=9 \mathrm{kN} / \mathrm{m}$. Load-duration class Medium-term and Service class 2 apply. Beam and column are LVL (Kerto-S). The dimensions of the beam are $b \times h=75 \times 400 \mathrm{~mm}^{2}$.
a.) Calculate the reaction forces and illustrate the internal forces $[\mathrm{M}],[\mathrm{V}],[\mathrm{N}]$. (1 point)
b.) Check all ULS requirements of the beam (instability is prevented). (3 points)
c.) At A the beam is supported on a $100 \times 100 \mathrm{~mm}^{2}$ member. Check the compression strength perpendicular to grain at the support A. (2 points)
d.) Name two solutions for the case that the compression perpendicular to grain requirement is not fulfilled. (1 point)
e.) Calculate the effective cross section (using reduced cross-section method) for the beam after $t=30 \mathrm{~min}$ fire exposure. (1 point)
f.) The beam is loaded out of plane with an additional uniform load $q_{\mathrm{d}, \mathrm{z}}=2 \mathrm{kN} / \mathrm{m}$. The beam can be assumed to be supported in point A and B. Check all ULS requirements of the beam (instability is prevented). (3 points)

## CIV-E 4110 Timber Engineering

## Examination date 27.5.2020

## General

- Write clearly on every paper you hand in: the code and name of the course, the date of the exam, your full name, your student number and your signature.
- Write clear and show intermediate steps.
- If some intermediate results are missing, choose an assumption (make a clear mark!) and continue the calculation.
- Use the material properties given in the appendix.

## Question

A LVL beam (Kerto-S, $l_{1}=2 \mathrm{~m}, l_{2}=7 \mathrm{~m}$ ) is loaded with a uniformly distributed design load $q_{\mathrm{d}}=9 \mathrm{kN} / \mathrm{m}$. Load-duration class Medium-term and Service class 2 apply. Beam and column are LVL (Kerto-S). The dimensions of the beam are $b \times h=75 \times 400 \mathrm{~mm}^{2}$.
a.) Calculate the reaction forces and illustrate the internal forces $[\mathrm{M}],[\mathrm{V}],[\mathrm{N}]$. (1 point)
b.) Check all ULS requirements of the beam (instability is prevented). (3 points)
c.) At A the beam is supported on a $100 \times 100 \mathrm{~mm}^{2}$ member. Check the compression strength perpendicular to grain at the support A. (2 points)
d.) Name two solutions for the case that the compression perpendicular to grain requirement is not fulfilled. (1 point)
e.) Calculate the effective cross section (using reduced cross-section method) for the beam after $t=30 \mathrm{~min}$ fire exposure. (1 point)
f.) The beam is loaded out of plane with an additional uniform load $q_{\mathrm{d}, \mathrm{z}}=2 \mathrm{kN} / \mathrm{m}$. The beam can be assumed to be supported in point A and B. Check all ULS requirements of the beam (instability is prevented). (3 points)

## Appendix

Characteristic values - LVL

| For LVL |  |  | Type |  |  |
